JSM 2021 STUDENT PAPER AWARD (ASA SECTIONS ON STATISTICAL COMPUTING AND STATISTICAL GRAPHICS)

Perception of exponentially increasing data displayed on a log scale

Emily A. Robinson[a], Reka Howard[a], Susan VanderPlas[a]

[a]Department of Statistics, University of Nebraska - Lincoln,

ABSTRACT
Log scales are often used to display data over several orders of magnitude within one graph. During the COVID pandemic, we've seen both the benefits and the pitfalls of using log scales to display data. This paper aims to...

KEYWORDS
Exponential; Log; Visual Inference; Perception

1. Introduction and Background

- Why Graphics? (communication to the public, technological advances, need for research on graphics)

Graphics are a useful tool for displaying and communicating information. Researchers include graphics to communicate their results in scientific publications and news sources rely on graphics to convey news stories to the public. During the onset of the novel coronavirus - COVID19 - pandemic, we saw an influx of dashboards being developed to displaying case counts, transmission rates, and outbreak regions (Charlotte (2020)). As a result, people began subscribing to news sources involved in graphically tracking the coronavirus (example John Burn-Murdoch Financial Times - SITE THIS) and gaining more exposure to the use of graphics. Many of these graphics helped guide decision makers to implement policies such as shut-downs or mandated mask wearing. Better software has meant easier and more flexible drawing, consistent themes, and higher standards. As a consequence, principles are needed on how to decide which of many possible graphics to draw (Unwin (2020)).

- Introduce Log Scales (what are they used for, where are they used (ecological data, covid, etc.))

One common graphical display choice is the use of log scales used to display data over several orders of magnitude within one graph. Logarithms convert multiplicative relationships to additive ones, providing an elegant way to span many orders of magnitude, to show elasticities and other proportional changes, and to linearize power laws

(Menge et al. (2018)). When presenting log-scaled data, it is possible to use either untransformed values (for example, values of 1, 10 and 100 are equally spaced along the axis) or log-transformed values (for example, 0, 1, and 2). We have recently experienced the benefits and pitfalls of using log-scales as COVID-19 dashboards displayed case count data on both the log and linear scale (Fagen-Ulmschneider (2020)). INSERT BENEFITS AND PITFALLS OF LOG SCALES HERE. While COVID-19 is the most well known example, log-scales have been used to display data in ecological research, etc. PUT OTHER AREAS HERE.

- Previous exponential (log/linear scale) studies (literature review).
    - Our default is on the log scale and the linear scale is a learnt behavior (Varshney and Sun (2013))
        - whole number magnitude representations progress from a compressive, approximately logarithmic distribution to an approximately linear one. Transitions occur earlier for smaller than for larger ranges of whole numbers, corresponding both to the complexity of the numbers and to the ages when children gain experience with them. In summary, estimation proceeds logarithmically initially and transitions to linear later in development, for several different numerical ranges. (Siegler and Braithwaite (2017))
        - in American children, logarithmic mapping does not disappear all at once, but vanishes first for small numbers and much later for larger numbers from 1 to 1000 (up to fourth or sixth grade in some children). (Dehaene et al. (2008))
    - Jones (1979), Jones (1977), Wagenaar and Timmers (1978)
    - misconceptions Menge et al. (2018)
- Visual Inference (what is it? how do we use it? etc.)
    - lineup protocal Buja et al. (2009)
    - visual p-values (SITE SUSAN'S NEW PAPER HOPEFULLY SOON)
- What is new in this paper.

Buja et al. (2009)

2. Data Generation

2.1. Model Generation and Simulation

2.2. Parameter Selection

- Use of lack of fit statistic.
- Mapping parameter selections to what we see visually.
- Curvature (Easy/Medium/Hard)

3.   Study Design

3.1.   *Lineup Setup*

3.2.   *Participant Recruitment*

3.3.   *Task Description*

- Lineup
  - The goal of this is to test an individuals ability to perceptually differentiate exponentially increasing data with differing rates of change on both the linear and log scale.

4.   Results

4.1.   *Effect of Curvature*

4.2.   *Effect of Variability*

4.3.   *Linear vs Log*

4.4.   *Participant Reasoning*

5.   Discussion

5.1.   *Conclusion*

5.2.   *Future Research*

- What we learned from lineups but what we still want to learn.
- You draw it
  - Mosteller et al. (1981) designed and carried out an empirical investigation to explore properties of lines fitted by eye. The researchers found that students tended to fit the slope of the first principal component or major axis (the line that minimizes the sum of squares of perpendicular rather than vertical distances) and that students who gave steep slopes for one data set also tended to give steep slopes on the others. Interestingly, the individual-to-individual variability in slope and in intercept was near the standard error provided by least squares for the four data sets.
  - The goal of this task is to test an individuals ability to make predictions for exponentially increasing data.
  - Previous literature suggests that we tend to underestimate predictions of exponentially increasing data. *find reference*
  - The idea for this task was inspired by the New York Times "You Draw It" page which is fun to check out.
- Estimation
  - This tests an individuals ability to translate a graph of exponentially increasing data into real value quantities. We then ask individuals to extend their estimates by making comparisons across levels of the independent variable.
  - Friel, Curcio, and Bright (2001) emphasize the importance of graph comprehension proposing that the graph construction plays a role in the ability
